

Automated Sciences GOES System Promotion

October 15th, 2013

Automated Sciences is announcing today special promotional pricing on our GOES Box and RVT Workstation combination. This combination combined with a new or existing satellite dish and feed creates a complete GOES GVAR direct reception ground station with outstanding features, capability, and performance.

The promotional pricing is **\$18,000USD** and includes both the GOES Box and the RVT Workstation for the NOAA GOES 13-15 satellites.

The system being offered in this promotion is as described in the GOES Box brochure and the RVT Workstation brochure on our web site. The satellite image analysis and processing software included with the systems is described in the SuperLooper brochure and the RVT Software brochures available on our web site at www.automatedsciences.com.

This promotion is mostly directed toward organizations or Met Services who are currently or have in the past directly received NOAA GOES satellite data and imagery. The system will work with an existing 3 meter or larger satellite dish and most existing satellite feeds and down-converters. In fact this system can be used along with an older existing system by simply splitting the satellite signal. However if you have not received this data in the past or do not have a usable dish or feed we can supply the additional items you need contact us for pricing and details.

In general the system can be self-installed with remote assistance and the system is preloaded with ten hours of high definition training videos that include satellite meteorology training. This should allow key people to quickly become familiar with how to use the system and effectively interpret the data and images. On site installation and training services are available contact us for pricing and details.

You may ask why are we offering this powerful system at a price less than half of our normal list price. Simple we want users to get an appreciation of the features and quality of our systems and technology in the final few years of this current generation of GOES Satellites. In the hope that once the new generation is available starting in 2017 that your organization will upgrade this system through us to receive and utilize data from the new generation of satellites.

We plan to offer both a moderate cost but somewhat limited upgrade package and a full upgrade package that allows you to take advantage of all the new satellites capabilities. We will be announcing more details on this in 2016 and will offer discounts to all existing users of our systems including those organizations that take advantage of this promotion.

To take advantage of this promotion the system must be ordered prior to October 15th, 2014 and you must take delivery by December 15th 2014. Payment either must be made in full prior to shipment or can be a confirmed irrevocable letter of credit with the terms that 80% is released upon shipment and the remaining 20% upon delivery. At our discretion we may participate in a competitive bid with this promotion however the cost of doing this will be added to this promotional pricing.

If you have questions or would like to order contact us at info@automatedsciences.com.
